 Certain drugs provoke compelling visual distortions and hallucinations, increase the intensity and salience of what you perceive, depress areas of the brain that let you introspect, and experience a personal sense of self, and make the ordinary stand out powerfully as never before...

Artists have intuitively manipulated these same systems to communicate emotional states and visual phenomena since first putting pigment on a cave wall. This session will bring together landscape art, hallucination, and the science of perception.

Neuroscience Outreach Group: Growing in Networks...

- Bill Griesar, Neuroscience Coordinator
- Jeff Leake, Arts Coordinator
- Dedicated volunteers from PSU, WSUV, OHSU, PNCA
Why art - and brains..?

• Motivation and engagement
• Exploration, creativity, and discovery
• Personal relevance of STEAM material
• Internships, jobs and careers
Who is involved?

- **Academic priority** K-12 students
  - Portland/Vancouver Public Schools
- Art and neuroscience undergraduates
  - Pacific Northwest College of Art, Portland State University, Washington State University Vancouver
- Art and neuroscience graduate students
  - PNCA, PSU, WSUV, Oregon Health & Science University
- Working artists and scientists
Where do we go?

- K-12 schools
- Universities
- Retirement communities
- Hospitals
- Science museums
- Art museums
- Conferences
- Homeless shelters
- Bike shops, pubs
- Thousands reached
Creative Science School
Art projects that...

Serve as examples of concepts

Illustrate concepts

Allow students to explore a concept
Artists and art students often reference other fields within their own work
Hallucinogens

Drugs that produce unusual sensory, perceptual and cognitive distortions

Derived from plants (mushrooms, cacti); but some are synthetic. Include: mescaline, psilocin, DMT, LSD
Depictions of the effects of hallucinogens

Yan Dargent  "Le rêve d'un êthêrès"  A depiction of ether-induced hallucinations 1865

Viktor Oliva  “The absinthe drinker” 1901

Robert Crumb  “LSD”
Mescaline
From dried crown of cacti (including **peyote cactus**). Common in northern Mexico, SW U.S.; used for thousands of years in cultural/religious rituals...

Aldous Huxley, 1950’s; 1960’s rise in U.S. use of peyote

“If the doors of perception were cleansed, the world would appear to man as it is, infinite...” - Blake
Psilocybin/Psilocin

Magic mushrooms; psilocybin converted to psilocin in vivo

Timothy Leary ("Turn on, tune in, drop out")

Timothy Leary founded the Harvard Psilocybin Project (1960 - 1962)

Algerian cave painting 3500 B.C.
Ayahuasca (Hoasca)

“Vine of the soul”
Brew from plants containing DMT and beta-carbolines

**DMT:** hallucinations, cognitive distortions

**Beta-carbolines** inhibit DMT breakdown by MAO

Christian Spiritist Sect; use protected by Supreme Court in 2006...
LSD

A synthetic **ergot** derivative synthesized by **Albert Hoffman** in 1938 (LSD-25)

Some derivatives toxic; some clinically useful

LSD re-examined in 1943; Hoffman ingested it (by accident) and took an unusual trip!

LSD is a very potent drug...

before LSD

after LSD!
Early applications

LSD initially available to psychiatrists and medical researchers (1940 - 1962)

**Psycholytic therapy:** Popular in Europe; LSD in psychotherapy to release repressed memories

**Psychedelic therapy:** Popular in U.S.; LSD in high doses for “spiritual” shock

**MK-ULTRA:** 1950’s CIA program, secret LSD administration to U.S. citizens; [British testing too](#)
Your brain: made of cells

- Neurons
- Neurons carry *electrical* messages
- Neurons connect *chemically* across synapses
- Neurotransmitters
All cells have membranes

Neurotransmitter or drug

Outside cells, including neurons

Many drugs, including hallucinogens, cannot get through, but instead act at RECEPTORS to affect neuron function...

Drugs like LSD attach (or “bind”) to receptors, changing the activity of affected neurons...

RECEPTORS: “Protein machines”
All hallucinogens act at ONE type of SEROTONIN receptor (5-HT2A)

Potency linked directly to hallucinogenic effects
Where are these receptors?

- Neocortex
  - Layer V
- Olfactory cortex
- Hippocampus
- Basal ganglia
- Thalamus
- Cerebellum
- Brainstem
- Spinal cord

Virginia Cornea-Hébert (1999)

Hallucinogens Enhance Sensory Responses in the Locus Coeruleus via 5-HT$_{2A}$ Receptors

“...it is of interest that the systemic administration of LSD, mescaline, or other psychedelic hallucinogens in rats, although decreasing spontaneous activity, produces a paradoxical facilitation of the activation of LC neurons by sensory stimuli...” (Aghajanian 1980; Rasmussen & Aghajanian 1986)
Kusama’s vast fields of polka dots, or "infinity nets," as she calls them, were taken directly from her hallucinations.

Yayoi Kusama "Infinity Mirrored Room- Filled with the Brilliance of Life"

The 50’s become the 60’s right before your eyes!
What else do hallucinogens do?

Neural correlates of the psychedelic state as determined by fMRI studies with psilocybin, Carhart-Harris et al, PNAS (2011)

Psychedelic drugs have a long history of use in healing ceremonies, but despite renewed interest in their therapeutic potential, we continue to know very little about how they work in the brain. Here we used psilocybin, a classic psychedelic found in magic mushrooms, and fMRI to capture the transition from normal waking consciousness to the psychedelic state.

Profound changes in consciousness were observed after psilocybin, but surprisingly, only decreases in cerebral blood flow were seen, maximal in hub regions, such as thalamus and anterior and posterior cingulate cortex (ACC and PCC). Decreased activity in the ACC/medial prefrontal cortex (mPFC) was a consistent finding and the magnitude of this decrease predicted the intensity of the subjective effects. Psilocybin caused a significant decrease in the coupling between the mPFC and PCC. These results strongly imply that the subjective effects of psychedelic drugs are caused by decreased activity and connectivity in the brain's key connector hubs, enabling a state of unconstrained cognition.
Greater functional connectivity

“there is an increased integration between cortical regions in the psilocybin state... One possible by-product of this greater communication across the whole brain is the phenomenon of synaesthesia which is often reported in conjunction with the psychedelic state...”
Charles Burchfield, *Autumnal Fantasy* 1916-1944
Changes in sense of “self”

“Worse than the demonic transformations of the outer world were the alterations that I perceived in myself...Every exertion of my will, every attempt to put an end to the dissolution of my ego, seemed to be wasted effort.”

- Albert Hoffman (1948)

“The fear, as I analyze it in retrospect, was of being overwhelmed, of disintegrating under a pressure of reality greater than a mind, accustomed to living in a cozy world of symbols, could possibly bear.”

“Who am I?”

- Solomon Snyder, “Drugs and the Brain”
"There was no doubt that this poor man was mad, but there is something in the madness of this man which interests me more than the sanity of Lord Byron and Walter Scott."
William Wordsworth

This image came to Blake during an 1819 séance.

Blake often said that he was joined by invisible sitters as he drew them, including, he claimed, a number of angels, Voltaire, Moses and the Flea, who told him that "fleas were inhabited by the souls of such men as were by nature blood thirsty to excess."

William Blake “The Ghost of a Flea” 1819–1820
“Default mode” network

Critical for...
Self-reflection
Self awareness
Rumination

*Decreased* activity on hallucinogens (psilocybin)

Carhart-Harris et al, PNAS (2011)
Is there a link between creativity and hallucinogens?

Created under the influence of a psychedelic in a clinical setting (Roubíček 1961)

From the early 1900s until about 1980 there was a great deal of interest in using hallucinogens to research creativity. In one early experiment in 1927 researchers injected subjects with morphine and asked them to illustrate their visual experiences.

Subject #17 was a doctor who was given 400 mg. Looking at a rug, she commented, "The whole carpet seemed to me without sense." She drew a stylized crab, an animated form that she imagined in the carpet.

mushroom-inspired image created by a French subject in Paris.
In 1952 Lászlo Mátéfi described how an experimental subject under the influence of a hallucinogen experienced a discrepancy between his intention and performance while making a portrait:

I see the object correctly but draw it falsely; my hands won't follow it.... This desire to paint is harder and harder for me to perform since the expanse of my experience pulls me more and more into it. Myself, the drawing, and the surroundings create a unity--and that hinders me because I cannot concentrate on the model. I have the need to bring everything including the painted picture into the surface of the image. Had the painting process been more of a technical success, I would have been able to produce a fantastically good work.

Distortion of body extremities is illustrated in a sophisticated way by a professional painter. This drawing was executed by a well-known Czech artist after the recovery from LSD intoxication.

Mandalas created before (left) and during (right) an LSD session conducted in 1972 at the Maryland Psychiatric Center.
A drawing of a model made by an experimental subject only 20 minutes after taking a dose of LSD.
After an hour and 25 minutes the subject sees the model clearly, but his hands are making sweeping movements.
Two hours 30 minutes: the subject feels that his consciousness resides in his drawing hand.
Shortly after the previous drawing, the subject feels he has captured a likeness in one sweep of his hand.
Two hours 45 minutes: everything is kaleidoscopic and mobile. The model’s face has become diabolical.
Four hours 25 minutes: the world grows quieter.
Five hours 45 minutes: the world ebbs and flows.
Eight hours: the subject is confused and tired. He finds his own drawing “boring”.
What artists come to mind when thinking of hallucinogenic drugs?

Salvador Dali

Hieronymus Bosch

Rene Magritte

Jackson Pollock
Hallucinogens as a strategy for making art

Stanislaw Witkacy

Type A -- Suitable rather for women's faces than for men's. Slick execution, with a certain loss of character in the interest of beautification or accentuation of "prettiness".

Type B -- Intensification of character, bordering on caricature. The head larger than natural size. The possibility of preserving "prettiness" in women's portraits, and even of intensifying it in the direction of the "demonic."

Type C, C + Co, E, C + H, C + Co + E, etc. -- Subjective characterization of the model, caricatural intensification both formal and psychological are not ruled out. Approaches abstract composition, otherwise known as Pure Form.

Stanislaw Witkacy “Self-portrait” 1938
Witkacy made this portrait under the influence of mescaline.

Witkacy made this portrait under the influence of peyote.

Stanislaw Witkacy “Teodora Bialynickiego-Birul” 1929

Stanislaw Witkacy “Neny Stachurskiej” 1929
Henri Michaux “Dessin Sous Mescaline” 1956

Henri Michaux “Dessin Sous Mescaline” 1962

Michaux's self-transcended drawings "Dessin mescalinien" from 1956/1957 – were done during various phases of neurological excitement induced by mescaline
Other forms of hallucination in art

One suggestion in Sack’s “Hallucinations” is that many stories of fairies and leprechauns may be a result of CBS hallucinations exasperated by macular degeneration.

Dadd however suffered from violent delusion and hallucinations likely a result of schizophrenia.

Following the death of his sister in 1897 Ernst described a hallucination he experienced in which the wood grain on a panel near his bed took on "successively the aspect of an eye, a nose, a bird's head, a menacing nightingale, a spinning top, and so on."

Max Ernst “Two Children Are Threatened by a Nightingale” 1924
Monet suffered from acute macular degeneration in the latter stages of his career.
How have artists manipulated these same systems to create a greater sense of visual and emotional impact?

Exaggeration of color

David Hockney “The Grand Canyon”
The exchange of natural forms into patterned elements

Gustav Klimt “Birchenwald”
Unusual juxtapositions

Rene Magritte “The Voice Of Blood” + Brain Cell
